Decision Problem

Decision Problem

given:

a set $\ensuremath{\mathcal{O}}$ of geometric objects and a container $\ensuremath{\mathcal{C}}$

Decision Problem

given:

a set $\ensuremath{\mathcal{O}}$ of geometric objects and a container $\ensuremath{\mathcal{C}}$

decide:

can the objects in \mathcal{O} be packed without overlap into C?

Decision Problem

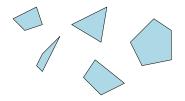

given:

a set $\ensuremath{\mathcal{O}}$ of geometric objects and a container $\ensuremath{\mathcal{C}}$

decide:

can the objects in \mathcal{O} be packed without overlap into C?

Example: PARTITION

given: a sequence $S = (a_1, ..., a_n)$ of integers

complexity class **P** (Decision-)problems, which can be answered efficiently, i.e., in running time polynomial in the size of the input.

complexity class NP

problems, for which a given positive solution can be verified efficiently.

Example: PARTITION

given: a sequence $S = (a_1, ..., a_n)$ of integers

question: Is it possible to decompose S into two subsequences whose sums are equal?

complexity class **P** (Decision-)problems, which can be answered efficiently, i.e., in running time polynomial in the size of the input.

complexity class NP

problems, for which a given positive solution can be verified efficiently.

Example: PARTITION

given: a sequence $S = (a_1, ..., a_n)$ of integers

question: Is it possible to decompose S into two subsequences whose sums are equal?

example:

complexity class **P** (Decision-)problems, which can be answered efficiently, i.e., in running time polynomial in the size of the input.

complexity class NP

problems, for which a given positive solution can be verified efficiently.

Example: PARTITION

given: a sequence $S = (a_1, ..., a_n)$ of integers

question: Is it possible to decompose S into two subsequences whose sums are equal?

example: 15 217 123 82 28 17 46 47 53 3 63 21 93

complexity class **P** (Decision-)problems, which can be answered efficiently, i.e., in running time polynomial in the size of the input.

complexity class NP

problems, for which a given positive solution can be verified efficiently.

Example: PARTITION

given: a sequence $S = (a_1, ..., a_n)$ of integers

question: Is it possible to decompose S into two subsequences whose sums are equal?

example: 15 217 123 82 28 17 46 47 53 3 63 21 93 15 217 123 82 28 17 46 47 53 <mark>3 63</mark> 21 93

grand open problem: Is P = NP?

grand open problem: Is P = NP?

A problem A is called **NP-hard**, if any problem in NP can be efficiently **reduced** to A, **NP-complete**, if it is in NP itself.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

grand open problem: Is P = NP?

A problem A is called **NP-hard**, if any problem in NP can be efficiently **reduced** to A, **NP-complete**, if it is in NP itself.

Example: PARTITION

grand open problem: Is P = NP?

A problem A is called **NP-hard**, if any problem in NP can be efficiently **reduced** to A, **NP-complete**, if it is in NP itself.

Example: PARTITION

Consequently:

grand open problem: Is P = NP?

A problem A is called **NP-hard**, if any problem in NP can be efficiently **reduced** to A, **NP-complete**, if it is in NP itself.

Example: PARTITION

Consequently:

If there is an efficient algorithm for an NP-hard problem, then P=NP.

grand open problem: Is P = NP?

A problem A is called **NP-hard**, if any problem in NP can be efficiently **reduced** to A, **NP-complete**, if it is in NP itself.

Example: PARTITION

Consequently:

 If there is an efficient algorithm for an NP-hard problem, then P=NP.

 If an NP-hard problem A can be reduced efficiently to a problem B, then B is NP-hard, as well.

grand open problem: Is P = NP?

A problem A is called **NP-hard**, if any problem in NP can be efficiently **reduced** to A, **NP-complete**, if it is in NP itself.

Example: PARTITION

Consequently:

- If there is an efficient algorithm for an NP-hard problem, then P=NP.
- If an NP-hard problem A can be reduced efficiently to a problem B, then B is NP-hard, as well.

It is well known: $NP \subseteq PSPACE$, the class of all problems solvable in polynomial *space*.

given: a set of rectangles \mathcal{R} , and a rectangular container R **question:** can the rectangles of \mathcal{R} be packed into R under translation?

given: a set of rectangles \mathcal{R} , and a rectangular container R **question:** can the rectangles of \mathcal{R} be packed into R under translation?

• Claim: PARTITION is efficiently reducible to PAR.

given: a set of rectangles \mathcal{R} , and a rectangular container R question: can the rectangles of \mathcal{R} be packed into R under translation?

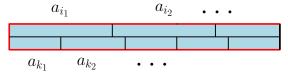

Claim: PARTITION is efficiently reducible to PAR.

given: a set of rectangles \mathcal{R} , and a rectangular container R question: can the rectangles of \mathcal{R} be packed into R under translation?

Claim: PARTITION is efficiently reducible to PAR.

partition $a_{i_1} + \ldots + a_{i_l} = a_{k_1} + \ldots + a_{k_m}$ is possible, iff

perfect packing is possible

given: a set of rectangles \mathcal{R} , and a rectangular container R **question:** can the rectangles of \mathcal{R} be packed into R under translation?

• Claim: PARTITION is efficiently reducible to PAR.

Consequently: PAR is NP-complete.

given: a set of rectangles \mathcal{R} , and a rectangular container R question: can the rectangles of \mathcal{R} be packed into R under translation?

Claim: PARTITION is efficiently reducible to PAR.

- Consequently: PAR is NP-complete.
- also, it follows or can easily be shown:
 - for rectangular/convex polygonal containers the corresponding optimization problems are NP-hard.

given: a set of rectangles \mathcal{R} , and a rectangular container R question: can the rectangles of \mathcal{R} be packed into R under translation?

• Claim: PARTITION is efficiently reducible to PAR.

- Consequently: PAR is NP-complete.
- also, it follows or can easily be shown:
 - packing of rectangles/arbitrary polygons into rectangular/polygonal containers under translation/rigid motion is NP-hard.
 - for rectangular/convex polygonal containers the corresponding optimization problems are NP-hard.

Approximation algorithms for NP-hard optimization problems:

Approximation algorithms for NP-hard optimization problems: Find efficiently an α -approximation, i.e., a solution at most a factor α worse than an optimal one.

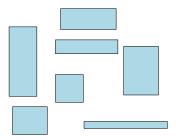

Approximation algorithms for NP-hard optimization problems: Find efficiently an α -approximation, i.e., a solution at most a factor α worse than an optimal one.
